

# *Paramount Lighting*

**Paramount Lighting helps flatten features and reduces textures, while giving a broad look to narrow faces. This type of lighting, made famous by *Paramount Studios*, helps emphasize cheek bones. You should see what appears to be a “butterfly” shadow under the nose. This butterfly should end half way between the upper lip and the nose. Your Key Light should be to the right of the camera, with a 45 degree angle and slightly high. The Fill Light should be higher and behind the Key Light source.**
